## Comparision with Formula: AE / Flow ~

- 고차원 변수 x, 잠재 변수 z
- z = f(x): f는 고차원에서 저차원
- x = g(z): g는 저차원에서 고차원
- x = g(f(x)): Auto-Encoder
- $f^{-1} => x$ : flow-based generative model

$$\int p(x)dx = \int \pi(z)dz = 1$$

$$p(x) = \pi(z) \Big| rac{dz}{dx} \Big| = \pi(f^{-1}(x)) \Big| rac{df^{-1}}{dx} \Big| = \pi(f^{-1}(x)) \Big| (f^{-1})'(x) \Big|$$

 $z \sim \pi(z)$  는 z가  $\pi(z)$ 라는 PDF를 따른다는 뜻.

$$\mathbf{z} \sim \pi(\mathbf{z}), \mathbf{x} = f(\mathbf{z}), \mathbf{z} = f^{-1}(\mathbf{x})$$

$$p(\mathbf{x}) = \pi(\mathbf{z}) \Big| \mathrm{det} rac{d\mathbf{z}}{d\mathbf{x}} \Big| = \pi(f^{-1}(\mathbf{x})) \Big| \mathrm{det} rac{df^{-1}}{d\mathbf{x}} \Big|$$
